🛡️ FrankPass: Master Visual & Security Guide

The Sovereign, Zero-Knowledge Deterministic Password & PIN Generator

Official Documentation & Step-by-Step Architecture Manual Created by Founder: Master Manikant Yadav (मास्टर मणिकान्त यादव) Official Ecosystem: frankpass.com | store.frankbase.com

1. The Core Philosophy: Why Cloud Vaults Fail vs. Stateless Security

The Fundamental Flaw of Traditional Password Managers

Traditional password managers (such as LastPass, 1Password, or Bitwarden) store your encrypted passwords in a centralized cloud database. While the encryption is mathematically strong, **storing data creates a permanent honey pot**:

1. **The Breach Target:** Hackers constantly attack cloud servers to steal encrypted vaults, downloading millions of customer records to crack offline using supercomputers and GPU clusters.
2. **Subscription Traps:** Traditional managers charge recurring fees of `$36` to `$60` every single year to maintain centralized server infrastructure and investor returns.
3. **Data Loss on Account Lockout:** If a cloud server experiences downtime, your subscription expires, or your account is suspended, you lose access to all your digital credentials.

The FrankPass Sovereign Breakthrough: Stateless Mathematics

FrankPass operates on a radically different cryptographic philosophy: **Never store what you can calculate.**

FrankPass does not store passwords anywhere:

- **0 Cloud Databases:** No passwords or secrets ever touch any server or cloud database.
- **0 Local File Storage:** No passwords are saved in your browser storage or hard disk files.
- **100% RAM Derivation:** FrankPass calculates your password on the fly using 1,000,000 rounds of PBKDF2-HMAC-SHA512 directly inside your computer's RAM via W3C WebCrypto.
- **Instant Memory Purge:** The moment you close the tab, lock your profile, or use the password, it vanishes completely from memory.

Detailed Comparison: Traditional Cloud Vaults vs. FrankPass

Feature	**Traditional Cloud Vaults**	**FrankPass Stateless Architecture**
Where are passwords saved?	On central cloud servers and databases	**Nowhere (0 Storage, 0 Database)**
Can hackers steal your vault?	Yes, if cloud servers are breached	**Impossible (No vault exists to steal)**
Offline functionality	Requires prior sync and periodic cloud check-in	**100% Offline in Airplane Mode (PWA & Extension)**
Free Tier Offering	Limited devices (1 device lock), feature-gated	**Free Forever (Web, PWA & Guest Extension, unlimited devices)**
Paid Tier & Pricing	$36 to $60 every year (recurring subscription)	**$25 Pay Once / Lifetime 1-PC (Zero recurring subscriptions)**
Volume Discounts	Enterprise quote only, per-user monthly charge	**30% off (2-5 PCs) and 50% off (6-20 PCs) lifetime**
Free Trial Policy	Requires email, credit card, and marketing opt-in	**30-Day Zero-PII Offline Free Trial (No card, no email)**
Device loss recovery	Complex emergency kits and recovery keys	**Recalculate mathematically anywhere via Master Key**
Security Principle	Security by Database Encryption	**Kerckhoffs's Principle of Pure Mathematics**

🎨 **[VISUAL DIAGRAM / GEMINI IMAGE SPOT]** *Prompt for Gemini in Google Docs: "Create a clean 3D isometric diagram comparing cloud password vaults (showing a hacker targeting a cloud server database) versus FrankPass stateless architecture (showing a local device calculating a key inside RAM with 1,000,000 iterations and immediate memory wipe, zero cloud communication)."*

---

2. Crafting Your Master Secret Key (The 4 Golden Rules & AI Prompts)

Traditional security advice instructs users to pick random gibberish like `P@$$w0rd!#99` (which you will inevitably forget) or standard dictionary phrases (which automated tools crack using dictionary attacks).

Founder Master Manikant Yadav has formulated the **4 Golden Rules for Worldwide Sovereign Passphrases**:

Rule 1: Personalize with a Real Human Anchor

Include your own name, a family member, a relative, or a close friend's name (e.g., *sohan, rohit, ramesh, elbert, priya*). This anchors the passphrase directly to your personal emotional memory so you never forget it across decades.

Rule 2: Form an Unrealistic, Absurd Visual Sentence (4 to 7 words)

Cognitive neuroscience proves that the human brain retains bizarre visual imagery for decades with zero effort. Automated cracking tools and AI models rely on logical grammar and common associations. An absurd mental visual is virtually impossible for an algorithm to guess!

Rule 3: Universal Roman Script (Worldwide QWERTY Invariant)

Whether your native language is English, Hindi, Spanish, Bengali, or German, always formulate your passphrase strictly in the **standard Roman alphabet (`a-z`, `0-9`)**. This ensures you can type your secret effortlessly on any keyboard, phone, airport kiosk, or terminal across the globe without special font packs or IME software.

Rule 4: Phonetic Clarity (Zero Dialect Confusion)

Strictly avoid ambiguous words that have multiple spelling variants across accents or transliterations (e.g. avoid *sankar* vs *shankar*, *laxmi* vs *lakshmi*, *ph* vs *f*, silent letters). Pick crisp, single-spelling words whose pronunciation and Roman spelling are unmistakable.

Absurd Visual Examples:

- **English Passphrases:**
  - `my friend sohan will fly on elephant`
  - `my brother elbert drives aeroplane on the road`
  - `uncle ramesh drinks hot tea on moon`
  - `tiger sohan eats pizza under blue water`
- **Romanized Multilingual / Hindi Passphrases:**
  - `meri nani rohit ke sath chand par chai pi rahi hai`
  - `chacha ramesh cycle se mars par gaye`
  - `mera dost sohan hathi par ud raha hai`

The Mathematical Engine Invariant (Whitespace & Symbol Immunity):

In FrankPass, our normalization engine converts the secret key to lowercase and removes all whitespace and non-alphanumeric punctuation: `normalizedSecret = secret.toLowerCase().replace(/[^a-z0-9]/g, '');`

This guarantees that:

- `my friend sohan will fly on elephant`
- `My Friend Sohan Will Fly On Elephant!`
- `myfriendsohanwillflyonelephant`

All produce the exact same unbreakable cryptographic password! Accidental spaces, capitalizations, or punctuation on mobile touchscreens will never lock you out.

1-Click AI Prompt for ChatGPT, Gemini, or Claude:

You are my private Passphrase Architect for frankpass.com. Help me generate an unbreakable, memorable Master Secret Key.

Rules:

1. Personalize with my family member or friend's name and create an absurd, unrealistic visual sentence (4 to 7 words).

2. Universal Roman Script only: regardless of language, write exclusively in standard Roman lowercase letters (a-z) and numbers (0-9).

3. Phonetic clarity: strictly avoid words with ambiguous transliterations (e.g. avoid shankar/sankar, lakshmi/laxmi).

4. Do not include special symbols or punctuation.

5. Provide 3 hilarious, viral-level absurd options.

6. Remind me to keep my final chosen phrase completely secret!

The Physical Sovereign Sheet: The 7-Day Muscle Memory Rule

Because FrankPass stores zero data and has no cloud reset links, nobody can recover a forgotten Master Passphrase.

1. **Write it on paper once:** Write your chosen sentence on a small index card.
2. **7-Day Practice:** For the first 7 days, look at the card and type your phrase manually into FrankPass once a day until your fingers type it via subconscious muscle memory.
3. **Store in Home Lockbox:** Store the paper card in a secure drawer, bank locker, or destroy it once memorized.

🖼️ **[SCREENSHOT 1: Master Secret Key Input Field with Strength Indicator]** *(Insert screenshot from `guide_assets/real_ui_captures/card_secret_highlighted.png` here).*

---

3. How to Use the Web App (frankpass.com & PWA) Step-by-Step

The FrankPass web application runs instantly on any browser without installing anything. It also installs as an offline Progressive Web App (PWA).

Step 1: Regional & Country Selector (195 Flags)

- **Location:** Located at the top of the main card (e.g. 🇮🇳 `India (IN)`).
- **Purpose:** Clicking opens a searchable selector for 195 nations. It populates intelligent platform autocomplete suggestions tailored to your region (e.g. IRCTC, SBI, Flipkart for India; Chase, Bank of America, Netflix for the US).
- **Impact on Mathematics: Zero (0%).** Changing your country does not alter the mathematical password output.

Step 2: Site / Platform Name (or Paste Full URL)

Tell FrankPass which service you are generating a password for.

- **Option A (Short Brand Name):** Simply type `google`, `amazon`, `github`, `netflix`, or `sbi`.
- **Option B (Paste Full Website URL):** If unsure, copy the full address from your browser bar (e.g. `https://mail.google.com/mail/u/0/` or `https://retail.onlinesbi.sbi/`) and paste it directly. FrankPass automatically strips protocol, tracking queries, and subdomains to extract the authoritative canonical seed!

🖼️ **[SCREENSHOT 2: Site / Platform Input Field with Auto-Complete Datalist]** *(Insert screenshot from `guide_assets/real_ui_captures/card_platform_highlighted.png` here).*

Step 3: Username (Salt) vs. Counter (Password Rotation)

Understanding the fundamental distinction between Username and Counter:

A. When to Leave Username Blank (Single Profile / Recommended):

- For services where you only have **one single account** (e.g. personal Netflix, LinkedIn, Spotify, Amazon).
- Leaving the field empty keeps password generation fast, predictable, and frictionless.

B. When to Enter Username (Multiple Accounts on the Same Platform):

- Use this when you operate multiple profiles on the same platform.
- **Example:**
  - Personal Gmail: Platform = `google`, Username = `john.personal@gmail.com`
  - Work Gmail: Platform = `google`, Username = `john.work@company.com`
- Each distinct username acts as an independent cryptographic salt, producing completely unique, uncrackable passwords for each profile.

C. When to Use the Counter Field (Password Rotation):

- Use the Counter when a corporate policy or banking system forces you to **rotate your password**.
- **Example:**
  - Current password: `Counter = 1`
  - Required 90-day reset: Increase `Counter = 2`
  - Next year reset: Increase `Counter = 3`
- You never need to invent a new password or change your Master Secret Key. The counter deterministically rotates your password mathematically!

D. Month & Year Rotation Mode:

- For corporate users whose employers mandate monthly or quarterly updates.
- Select Month (e.g. `October`) and Year (e.g. `2026`) in Advanced Settings to calculate date-bound passwords.

🖼️ **[SCREENSHOT 3: Advanced Settings Panel with Username and Counter]** *(Insert screenshot from `guide_assets/real_ui_captures/card_advanced_open.png` here).*

Step 4: Generating Deterministic 4 & 6-Digit ATM & UPI PINs

FrankPass features a dedicated, mathematically isolated PIN generator (`/pin.html`):

- **4-Digit PIN:** Perfect for debit card ATM withdrawals and POS terminals.
- **6-Digit PIN:** Perfect for UPI applications (PhonePe, Google Pay, Paytm, BHIM) and mobile banking apps.
- **Anti-Trivial Safeguard:** FrankPass automatically detects and eliminates weak, predictable sequences (such as `1234`, `0000`, `1111`, `7777`) to ensure your financial PINs withstand shoulder-surfing and brute-force attacks.

🖼️ **[SCREENSHOT 4: Dedicated PIN Generator Tab]** *(Insert screenshot from `guide_assets/real_ui_captures/card_pin_generator.png` here).*

Step 5: Tri-State Blur Shield & Clipboard Protection

FrankPass includes comprehensive visual and operating system safeguards:

1. **Tri-State Blur Shield (Shoulder-Surfing Defense):**
   - **Default State:** Generated passwords and PINs are completely blurred on screen.
   - **Hover Peek:** Moving your cursor over the password reveals it temporarily. Moving away re-blurs it immediately.
   - **Click Lock Visible:** Clicking the eye icon locks the text unmasked when needed.
2. **Automatic 30-Second Clipboard Auto-Clear:**
   - Clicking Copy copies the password to your system clipboard.

- A 30-second countdown immediately starts. Upon expiration, FrankPass wipes your operating system clipboard clean, preventing background snooping apps from stealing your credentials.

3. **Optional Client-Side AES-GCM 256 Local Encryption:**
   - Enabling `Remember Secret Key on this device` encrypts your key in local browser memory using 256-bit AES-GCM.
   - It is never transmitted across the internet and can be purged instantly by toggling the switch off.

🖼️ **[SCREENSHOT 5: Output Card with Masked Display & Auto-Clear Countdown]** *(Insert screenshot from `guide_assets/real_ui_captures/card_output_highlighted.png` here).*

---

4. Single Sign-On (SSO) vs. Split Ecosystems vs. Isolated Banking

Modern internet authentication is divided into three distinct architectural models. Understanding these prevents catastrophic security mismatches:

The 3 Authentication Models:

1. UNIFIED SSO (Single Sign-On)

   Google / Apple / Cloudflare / Adobe

   └── Gmail, YouTube, Google Drive, Gemini share 1 single master password.

2. SPLIT / TIERED ARCHITECTURE

   Amazon Retail (amazon.in / primevideo.com) ──> Consumer Shopping Credentials

   AWS Cloud (aws.amazon.com / console) ──> Isolated Root / IAM Cloud Credentials

3. STRICTLY ISOLATED ARCHITECTURE (Banking & Government)

   Retail NetBanking (retail.onlinesbi.sbi) ──> Personal Savings Account

   Corporate Banking (yonobusiness.sbi) ──> Separate Corporate Authorization

Credit Card Portal (sbicard.com) ——> Independent Card Login

Demat & Trading (sbisecurities.in) ——> Separate Brokerage Credentials

1. Unified Single Sign-On (SSO)

In a Unified SSO system, the parent corporation operates a central Identity Provider (IdP).

- **The Reality:** There is only **one single password** for the entire fleet of subsidiary products.
- **Examples:**
  - **Google:** `gmail.com`, `youtube.com`, `studio.youtube.com`, `drive.google.com`, `photos.google.com`, `gemini.google.com`.
  - **Apple:** `icloud.com`, `appleid.apple.com`, `appstore.com`, `developer.apple.com`.
  - **Cloudflare:** `cloudflare.com`, `dash.cloudflare.com`, `workers.cloudflare.com`.
- **How FrankPass Handles This:** When you enter `studio.youtube.com`, `artists.youtube`, or `gmail.com`, FrankPass automatically maps them to the canonical slug **`google`**. Your password is 100% identical and works across the entire Google ecosystem!

2. Split / Tiered Architecture

In a split system, consumer shopping portals and developer/enterprise infrastructure are strictly segregated.

- **The Amazon Case Study:**
  - **Amazon Retail (`amazon.in`, `amazon.com`, `primevideo.com`):** Consumer e-commerce shopping.
  - **AWS Cloud (`aws.amazon.com`, `console.aws.amazon.com`):** Cloud infrastructure, EC2, and S3 servers.
- **Why Separation is Critical:** If a family member uses your Amazon shopping account to buy books, you cannot risk granting them root access to multi-million dollar AWS cloud infrastructure.
- **How FrankPass Handles This:** FrankPass recognizes `amazon.in` as **`amazon`** and `aws.amazon.com` as **`aws`**, keeping your cloud infrastructure cryptographically isolated from your retail shopping.

3. Strictly Isolated Multi-Tier Banking & Government

Financial institutions enforce statutory, cryptographic isolation:

- **State Bank of India (SBI):**

    - Personal NetBanking (`onlinesbi.sbi`)
    - Corporate YONO (`yonobusiness.sbi`)
    - SBI Card (`sbicard.com`)
    - SBI Securities (`sbisecurities.in`)
- **How FrankPass Handles This:** FrankPass never merges distinct banking subdomains. Furthermore, FrankPass provides a dedicated **`Simple` (Alphanumeric)** profile preset specifically for legacy banking portals that disallow special symbols.

Complete Platform Registry & Comparison Table

Platform / Brand	**Real-Life System**	**URL Examples**	**FrankPass Canonical Resolution**	**Password Behavior**
Google	Unified SSO	`gmail.com`, `youtube.com`, `drive.google.com`	`google`	**Single Password:** Shared across all Google services.
Cloudflare	Single Master Account	`dash.cloudflare.com`, `workers.dev`	`cloudflare`	**Single Password:** 1 Master dashboard controls DNS and Edge workers.
Microsoft	Split (Consumer vs Azure)	`outlook.com` vs `portal.azure.com`	`microsoft` vs `azure`	**Two Identities:** Consumer Outlook is isolated from Enterprise Azure.
Amazon	Split (Retail vs AWS)	`amazon.in` vs `aws.amazon.com`	`amazon` vs `aws`	**Strictly Separated:** Shopping breach never compromises AWS cloud.

Platform / Brand	Real-Life System	URL Examples	FrankPass Canonical Resolution	Password Behavior
Apple	Unified Apple ID	`appleid.apple.com`, `icloud.com`	`apple`	**Single Password:** Apple ID syncs across all Apple hardware and iCloud.
Meta	Hybrid Social	`facebook.com` vs `instagram.com`	`facebook` vs `instagram`	**Independent:** Facebook and Instagram maintain separate direct passwords.
Banking	Multi-Tier Isolated	`onlinesbi.sbi` vs `sbicard.com`	Isolated per domain	**100% Isolated:** Retail, Corporate, and Credit Cards never share passwords.

---

5. Browser Extension Mastery (Chrome, Edge, Brave, Opera, Firefox)

The FrankPass browser extension brings zero-storage deterministic security directly into daily web browsing.

Step 1: Install from Official Stores

- **Google Chrome:** Install from the official Chrome Web Store.
- **Microsoft Edge:** Install from Microsoft Edge Add-ons.
- **Firefox, Brave, Opera:** Compatible across all Chromium and Gecko based browsers.

Step 2: Free Guest Mode vs. Founder Lifetime Pass

- **100% Free Guest Mode:** Works out of the box with zero sign-up or licensing. Instant deterministic generation and DOM autofill on unlimited machines.

- **Founder Lifetime Pass (Hardware-Bound):** Unlocks multi-profile vaults (Personal, Work, Banking), 4-digit quick PIN unlock, and anti-phishing domain isolation permanently with no subscription fees.

Step 3: Global Keyboard Shortcuts (Instant Summon)

Instead of reaching for the mouse, use the native global keyboard shortcut on any login or registration page:

- **Windows / Linux:** `Ctrl + Shift + F`
- **macOS:** `Cmd + Shift + F`

What happens instantly:

1. The FrankPass extension popup opens immediately.
2. FrankPass automatically detects and normalizes the active tab's domain.
3. Type your Master Secret Key (or enter your 4-digit Quick PIN).
4. Press `Enter` or click ⚡ **`Auto-Fill`**.

Step 4: 1-Click Direct DOM Autofill (Defeating Clipboard Sniffers)

Operating system clipboards are inherently vulnerable. Malicious background software and clipboard snooping scripts can read copied credentials.

- When you click ⚡ `Auto-Fill` in FrankPass, the extension injects your username and password **directly into the Document Object Model (DOM) input fields** of the webpage.
- **Zero Clipboard Trace:** The credentials never enter your operating system clipboard, keeping them immune to clipboard sniffers!

Step 5: Anti-Phishing Domain Isolation

How FrankPass protects you against sophisticated phishing websites:

- Cybercriminals frequently register deceptive look-alike domains (e.g. `paypa1.com` instead of `paypal.com`, or `goog1e.com` instead of `google.com`).
- Traditional password managers often get tricked into autofilling stored credentials on look-alike domains.
- **The FrankPass Mathematical Defense:** Because passwords are derived from the domain name itself, `paypa1.com` produces a completely different cryptographic hash than `paypal.com`. Your genuine password is never exposed to fake phishing portals!

Step 6: Multi-Profile Management & 4-Digit Quick PIN Lock

In FrankPass Pro, you can configure distinct identity profiles:

- **Personal:** Social media, entertainment, personal banking.
- **Work / Office:** Company portals, staging servers, corporate email.
- **Client / Freelance:** Isolated customer credentials.

Each profile can be locked with a local **4-digit Quick PIN**. This allows you to generate passwords throughout the workday without re-typing your full Master Secret Key every time.

Step 7: Sovereign Encrypted Backup (.frankpass)

- Navigate to Settings -> **Export Encrypted Backup (.frankpass)**.
- Download your encrypted profile setup. When setting up a new computer or reinstalling your browser, click **Import Backup** to restore your complete environment in seconds.

---

6. Hardware Device ID (HWID) Extraction & Verification Guide

FrankPass Pro operates on a sovereign, zero-server economic model. Licenses are bound cryptographically to the physical machine rather than a centralized cloud user account.

Why FrankPass Uses Hardware-Bound Licensing

1. **100% Air-Gapped Verification:** License keys (`FP-XXXX-XXXX-XXXX`) are verified locally inside browser RAM using HMAC-SHA256 math. The extension never communicates with our servers to verify your license.
2. **Zero Surveillance & Zero Telemetry:** Because there are no user accounts, FrankPass cannot track which websites you visit or how often you generate passwords.

Method 1: Automated 1-Click Retrieval in FrankPass Pro (Recommended)

You do not need to run terminal commands to find your Hardware Device ID:

1. Open the FrankPass Pro extension popup.
2. Click **"Unlock Pro Profiles"** or navigate to the Activation screen.
3. Your machine's persistent **Hardware Device ID** (e.g. `FP-8A2F-9C14-EE30`) is displayed on screen.
4. Click the **"Copy ID"** button to copy it instantly for store checkout.

Method 2: Manual Hardware Motherboard Verification Across Operating Systems

For technical audits and hardware entropy verification across different operating systems:

A. Microsoft Windows:

Open PowerShell or Command Prompt:

```
# PowerShell (Recommended)

(Get-CimInstance -Class Win32_ComputerSystemProduct).UUID

# Command Prompt (CMD Alternative)

wmic csproduct get uuid
```

B. Apple macOS:

Open Terminal:

```
# macOS Terminal (Hardware UUID)

system_profiler SPHardwareDataType | grep 'Hardware UUID'

# Alternative via I/O Kit Registry

ioreg -rd1 -c IOPlatformExpertDevice | grep IOPlatformUUID
```

C. Linux (Ubuntu, Debian, Fedora, Arch):

Open Terminal:

```
# System Machine ID

cat /etc/machine-id

# Motherboard System UUID (Requires root privileges)

sudo dmidecode -s system-uuid
```

Hardware Drift Immunity:

FrankPass binds to core motherboard silicon entropy (`navigator.hardwareConcurrency`, WebGL hardware vendor, core OS platform). It is completely immune to monitor changes, display resolution adjustments, battery replacements, or timezone shifts.

---

7. Offline PWA & Disaster Recovery (The Single-File Myth Corrected)

Correcting the Misconception: Why Single-File HTML Runers are Obsolete

A common misconception in offline password security is that users should carry a "single-file offline HTML runner" on a USB drive or run Python scripts in a terminal.

- Single HTML files can easily be lost, corrupted, or accidentally deleted.
- Non-technical users find command-line Python scripts intimidating and impractical on mobile devices.

The True Sovereign Solution: The FrankPass Progressive Web App (PWA)

FrankPass is engineered as a modern, installable **Progressive Web App (PWA)**:

1. Open `https://frankpass.com` in your browser on desktop or mobile.
2. Click the **"Install App"** icon in the URL bar (or tap "Add to Home Screen" on iOS Safari and Android Chrome).
3. The PWA installs immediately as a standalone, native-feeling application with its own dedicated window and app icon.

The Airplane Mode Disaster Recovery Test

Verify your complete independence from cloud servers:

1. Turn off your Wi-Fi, Ethernet, and mobile data (switch to **Airplane Mode**).
2. Launch the installed FrankPass PWA from your desktop or phone home screen.
3. Enter your Master Secret Key and website name.
4. **Result:** Your exact, unbreakable password is calculated in less than 0.1 seconds directly inside RAM with **zero network requests**!

What Happens if Your Laptop or Phone is Lost or Destroyed?

With traditional cloud password managers:

- If you lose your phone and 2FA app, or forget your master recovery key, you are locked out permanently.
- If the company's servers experience a major outage, you cannot log into your bank or work portals.

With FrankPass:

- **Your credentials are not trapped inside any physical device.**
- If your laptop burns, phone drops in water, or you are travelling in a foreign country:
    1. Simply open any web browser on any computer or phone anywhere in the world.
    2. Visit `frankpass.com` (or launch the PWA).
    3. Enter your memorable Master Secret Key and the platform name.
    4. **Your exact password is recalculated instantly with 100% mathematical precision!**

The Permanent Mathematical Invariant:

FrankPass utilizes the open, standardized cryptographic algorithm **PBKDF2-HMAC-SHA512 with 1,000,000 computational rounds**.

- Mathematics never shuts down.
- Even if FrankPass as a company ceased to exist decades from now, the mathematical formula is immutable and eternal. You will always be able to recalculate your credentials anywhere on Earth for the rest of your life.

---

8. Troubleshooting & Friction Points Matrix

Pain Point / Scenario	**Root Cause**	**FrankPass Sovereign Solution**
"My password today is different from yesterday!"	User had a typo in their Master Secret Key, or typed a different platform name (e.g., `gmail` vs `google`).	**Solution:** FrankPass platform normalization automatically aliases common services. Verify that your Master Secret Key sentence has zero typos. Because FrankPass is pure math, identical input guarantees 100% identical output.

Pain Point / Scenario	Root Cause	FrankPass Sovereign Solution
"Auto-Fill didn't fill the login box on my bank's site."	Legacy banking portals often place login credentials inside cross-origin `<iframe>` containers that browser security sandboxes block.	**Solution:** Use the 1-click **"Copy Password"** button in the extension. The built-in 30-second clipboard timer automatically purges the clipboard after pasting.
"I forgot my 4-digit Pro extension PIN!"	User set a quick unlock PIN on their laptop and forgot the code.	**Solution:** Click **"Forgot PIN"** to answer your 3 security questions. Even if you forget the questions, your passwords are NOT lost! Simply open the Free Guest Mode and enter your Master Secret Key. Passwords exist in math, not in stored files!
"A legacy portal requires an 8-character password without symbols."	Old government or financial websites enforce restrictive password rules.	**Solution:** Open Advanced Options. Adjust the **Length Slider** to `8` or `10` characters and select the **`Simple` (Alphanumeric)** profile preset.
"Can I move my FrankPass Pro setup to a new PC?"	User purchased a new laptop or upgraded hardware.	**Solution:** Export your `.frankpass` encrypted backup file from the old PC and import it into the new PC. Contact our support desk with your order details for a seamless hardware license re-bind.

---

9. Pricing, Volume Discounts & Transparent Community Channels

FrankPass operates on a zero-server economic model: because we store zero bytes on cloud servers, we never charge recurring subscription traps.

A. Volume Pricing Matrix (Hardware-Bound Lifetime License)

Plan / Tier	Physical Machines	Discount	Final Price per PC	Total Cost
Solo License	1 PC	Standard Rate	**`$25.00`**	**`$25.00`** (Lifetime)
Family / Team Tier	2 to 5 PCs	**30% OFF**	**`$17.50`**	2 PCs = `$35.00` | 5 PCs = `$87.50`
Volume Power Tier	6 to 20 PCs	**50% OFF**	**`$12.50`**	6 PCs = `$75.00` | 10 PCs = `$125.00` | 20 PCs = `$250.00`

- **Transaction Cap:** Maximum 20 PCs per order for card verification and security compliance.
- **100% Air-Gapped Independence:** Every machine receives its own unique hardware-bound offline key (`FP-XXXX-XXXX-XXXX`). Devices have 0% shared data or inter-device networking.

B. 30-Day Zero-PII Offline Free Trial

- Every physical computer is entitled to a **30-Day Offline Free Trial**.
- **Zero PII Collected:** No email address, no phone number, and no credit card required.
- Verification occurs 100% offline inside your browser RAM.

C. 3 Transparent Community Discount Channels

1. **The Patron Channel (`$25.00`):** If you have the financial means, paying the full `$25` supports independent, zero-cloud software engineering with zero investor compromise.
2. **The Silent Buyer Coupon (`PRIVACY20` -> `$20.00`):** If you are a privacy-conscious user who prefers not to post on social media, apply the coupon code **`PRIVACY20`** at checkout on store.frankbase.com for an instant 20% discount (`$20.00` total clean pricing).
3. **The Community Advocate Channel (75% OFF -> `$6.25`):** Use FrankPass Pro for 10 days on the free trial. If you love the sovereign experience, post an honest review on X (Twitter) mentioning **`@frankpasshq`** and **`@mastermanikant`**. Our team will verify your post and send a single-use 75% off coupon directly to your X direct message inbox!

---

10. Psychological Threat Model & Technical FAQ

Q1: If I post about FrankPass on X, will hackers target me?

Answer (Kerckhoffs's Principle): No. FrankPass has zero server databases and zero cloud accounts. Even if an attacker knows you use FrankPass, they gain exactly zero advantage:

1. They do not know your mental Master Secret Key.
2. They do not know your password counter (e.g. 1, 2, or 3).
3. Under Kerckhoffs's Principle of cryptography, a security system remains 100% secure even if the attacker knows every single line of code and the exact tool being used, so long as the secret key remains private.

Q2: You say privacy is a human right. What about users who cannot afford `$25`?

Answer: The FrankPass Web App and Guest Browser Extension are **100% Free Forever for everyone on Earth**. For users desiring the hardware-bound Pro extension, we offer the transparent **75% off Community Advocate channel (`$6.25`)** or the **20% instant coupon (`PRIVACY20` -> `$20.00`)**.

Q3: Does the browser extension send my passwords or data over the internet?

Answer: Never. FrankPass Pro uses the browser's built-in `window.crypto.subtle` API. It does not contain any analytics trackers, remote logging libraries, or backend API calls. You can inspect the network tab in Developer Tools or turn off your Wi-Fi: the extension functions with zero network activity.

Q4: If FrankPass company closes tomorrow, what happens to my passwords?

Answer: Mathematics never shuts down. FrankPass passwords are deterministic mathematical equations, not stored records. You can install the official FrankPass PWA directly from frankpass.com for permanent offline usage on any machine. Furthermore, because FrankPass uses the open PBKDF2-HMAC-SHA512 standard, you will always be able to recalculate your passwords on any computer, anywhere, for the rest of your life.

Q5: What if I lose my Master Secret Key?

Answer: Because FrankPass stores zero data and contains zero backdoors, **nobody can recover a forgotten Master Secret Key**. You should choose a strong phrase that is personally unforgettable to you following our 4 Golden Rules (such as a memorable sentence from your life combined with an absurd visual anchor).

Q6: Can a browser extension update compromise my security?

Answer: No. FrankPass extension source code is open, reproducible, and packaged with zero external dependencies. Updates cannot secretly harvest passphrases because all cryptographic operations remain strictly sandboxed in local RAM.

---
